it because it will find the money for more chances and further for well along life. This is not single-handedly about the perfections that we will offer.

Read Book Barrier Coverage With Wireless

We study the problem of barrier coverage with a wireless sensor network. Each sensor is modelled by a point in the plane and a sensing disk or coverage area centered at the sensor's position. The barriers are usually modelled as a set of line segments on the

Read Book Barrier Coverage With Wireless

plane. The barrier coverage problem is to add new sensors or move existing sensors on the barriers such that every point on every barrier is within the coverage area of some sensors. Barrier coverage using sensors has important applications,

Read Book Barrier Coverage With Wireless Sensors in Algorithm

including intruder detection or monitoring the perimeter of a region. Given a set of barriers and a set of sensors initially located at general positions in the plane, we study three problems for relocatable sensors in the centralized setting: the feasibility

Read Book Barrier Coverage With Wireless

Sensors, the problems of minimizing the maximum or the average relocation distances of sensors (MinMax and MinSum respectively) for barrier coverage. We show that the MinMax problem is strongly NP-complete when sensors have arbitrary

Read Book Barrier Coverage With Wireless

Sensors can move to arbitrary positions on the barrier. We also study the case when sensors are restricted to use perpendicular movement to one of the barriers. We show that when the barriers are parallel, both the MinMax and MinSum problems can be solved

Read Book Barrier Coverage With Wireless

Sensors in Algorithms

in polynomial time. In contrast, we show that even the feasibility problem is strongly NP-complete if two perpendicular barriers are to be covered. For the barrier coverage problem in distributed settings, we give the first distributed local algorithms for

Read Book Barrier Coverage With Wireless

fully synchronous unoriented sensors. Our algorithms achieve barrier coverage for a line segment barrier when there are enough sensors to cover the entire barrier. Our first algorithm is oblivious and terminates in n^2 time, whereas our second one

Read Book Barrier Coverage With Wireless

uses two bits of memory at each sensor, and takes n steps, which is asymptotically optimal.

However, if the sensors are semi-synchronous, and do not share the same orientation, we show that no algorithm exists that always terminates within finite

Read Book Barrier Coverage With Wireless

time. Finally, for sensors that share the same orientation we give an algorithm that terminates within finite time, even if all sensors are fully asynchronous. Finally, we study barrier coverage with multi-round random deployment using stationary

Read Book Barrier Coverage With Wireless Sensors. We analyze the probability of barrier coverage with uniformly dispersed sensors as a function of parameters such as length of the barrier, the width of the intruder, the sensing range of sensors, as well as the density of deployed sensors. We propose

Read Book Barrier Coverage With Wireless

two specific deployment strategies and analyze the expected number of deployment rounds and deployed sensors for each strategy. We present a cost model for multi-round sensor deployments, and for each deployment strategy we find the

Read Book Barrier Coverage With Wireless

optimal density of sensors to be deployed in each round that minimizes the total expected cost. Our results are validated by extensive simulations.

Read Book Barrier Coverage With Wireless

This book will serve as a reference, presenting state-of-the-art research on theoretical aspects of optimal sensor coverage problems. Readers will find it a useful tool for furthering developments on theory and applications of optimal coverage;

much of the content can serve as material for advanced topics courses at the graduate level. The book is well versed with the hottest research topics such as Lifetime of Coverage, Weighted Sensor Cover, k -Coverage, Heterogeneous Sensors, Barrier,

Read Book Barrier Coverage With Wireless Sweep and Partial Coverage, Mobile Sensors, Camera Sensors and Energy-Harvesting Sensors, and more. Topics are introduced in a natural order from simple covers to connected covers, to the lifetime problem. Later, the book begins revisiting earlier

Read Book Barrier Coverage With Wireless

Sensors with Orthogonal Li
problems ranging from the
introduction of weights to
coverage by k sensors and partial
coverage, and from sensor
heterogeneity to novel problems
such as the barrier coverage
problem. The book ends with
coverage of mobile sensors,

Read Book Barrier Coverage With Wireless

Sensors, energy-harvesting sensors, underwater sensors, and crowdsensing.

Barrier coverage is a critical issue in wireless sensor networks (WSNs) for security applications, which aims to detect intruders

Read Book Barrier Coverage With Wireless

attempting to penetrate
protected areas. However, it is
difficult to achieve desired barrier
coverage after initial random
deployment of sensors because
their locations cannot be
controlled or predicted. In this
dissertation, we explore how to

Read Book Barrier Coverage With Wireless

Sensors: An Algorithmic Approach
leverage the mobility capacity of mobile sensors to improve the quality of barrier coverage. We first study the 1-barrier coverage formation problem in heterogeneous sensor networks and explore how to efficiently use different types of mobile sensors

Read Book Barrier Coverage With Wireless

to form a barrier with pre-deployed different types of stationary sensors. We introduce a novel directional barrier graph model and prove that the minimum cost of mobile sensors required to form a barrier with stationary sensors is the length of

Read Book Barrier Coverage With Wireless

the shortest path from the source node to the destination node on the graph. In addition, we formulate the problem of minimizing the cost of moving mobile sensors to fill in the gaps on the shortest path as a minimum cost bipartite

Read Book Barrier Coverage With Wireless

assignment problem and solve it in polynomial time using the Hungarian algorithm. We further study the k -barrier coverage formation problem in sensor networks. We introduce a novel weighted barrier graph model and prove that determining the

Read Book Barrier Coverage With Wireless

Sensors (Algorithm II)

minimum number of mobile sensors required to form k -barrier coverage is related with but not equal to finding k vertex-disjoint paths with the minimum total length on the WBG. With this observation, we propose an optimal algorithm and a faster

Read Book Barrier Coverage With Wireless

greedy algorithm to find the minimum number of mobile sensors required to form k -barrier coverage. Finally, we study the barrier coverage formation problem when sensors have location errors. We derive the minimum number of mobile

Read Book Barrier Coverage With Wireless

Sensors needed to fill in a gap with a guarantee when location errors exist and propose a progressive method for mobile sensor deployment. Furthermore, we propose a fault tolerant weighted barrier graph to find the minimum number of mobile

Read Book Barrier Coverage With Wireless

Sensors needed to form barrier coverage with a guarantee. Both analytical and experimental studies demonstrated the effectiveness of our proposed algorithms.

Read Book Barrier Coverage With Wireless Sensors Iti Algorithmik li

Abstract: Wireless sensor networks (WSN) promise to revolutionize the way we monitor our surroundings by enhancing our senses. Prototype systems are already being demonstrated. Several fundamental research

Read Book Barrier Coverage With Wireless Issues, however, remain

unaddressed. Sensing events being the main task of a WSN, appropriately addressing the issue of coverage is critical. In this dissertation, we make a two fold contribution on establishing a strong foundation for the issue of

Read Book Barrier

Coverage With Wireless

Sensors in Algorithmic
coverage. First, we argue that a single concept of coverage such as k -full coverage (where every point in the deployment region needs to be within the monitoring range of at least k sensors) does not fit all applications. We propose a new concept of

Read Book Barrier Coverage With Wireless

coverage called k -barrier coverage that is appropriate for intrusion detection applications. A WSN provides k -barrier coverage if it guarantees that every penetrating object is detected by at least k sensors before crossing the barrier of sensors. Second, we

Read Book Barrier Coverage With Wireless

address five foundational problems for the issue of k -barrier coverage: optimal deployment pattern, critical conditions, coverage status determination, coverage restoration, and optimal sleep wakeup. The problem of optimal deployment pattern is to

Read Book Barrier Coverage With Wireless

Sensors and Algorithms II
determine a pattern of deployment that uses the minimum number of sensors. The problem of critical conditions is to derive conditions that can be used to determine the minimum number of sensors to deploy in probabilistic deployments. The

Read Book Barrier Coverage With Wireless

problem of coverage status determination is to determine whether a deployed WSN provides a desired quality of monitoring. The problem of coverage restoration is to determine the minimum number of sensors to deploy, and their

Read Book Barrier Coverage With Wireless

locations, such that a desired quality of monitoring can be restored in a deployed WSN. The problem of optimal sleep wakeup is to produce a sleeping schedule for sensors that maximizes the network lifetime. We comprehensively solve four of the

Read Book Barrier Coverage With Wireless

five foundational problems. For the problem of critical conditions, we derive the conditions for a weaker notion of k -barrier coverage, called weak k -barrier coverage. In addition, we derive critical conditions for the case of k -full coverage.

Read Book Barrier Coverage With Wireless Sensors Iti Algorithmik li

The advances in sensor design have decreased the size, weight, and cost of sensors by orders of magnitude, yet with the increase of higher spatial and temporal resolution and accuracy. With the fast progress of sensors design and

Read Book Barrier Coverage With Wireless Sensor Network Algorithms

sensor networks have also been quickly evolving in both research and practical domains in the last decade. More and more sensor networks have been deployed in real-world to gather information for our daily life. Applications of

Read Book Barrier Coverage With Wireless

Sensor networks can be found in battle?eld surveillance, environmental monitoring, biological detection, smart spaces, industrial diagnostics, etc.

Although the technique of sensor networks has a very promising future, many challenges are still

Read Book Barrier Coverage With Wireless

deserving lots of research efforts for its successful applications. This book is devoted to coverage control, one of the most fundamental and important research issues in sensor networks. The aim of the book is to provide tutorial-like and up-to-date reference resources on

Read Book Barrier Coverage With Wireless

Various coverage control problems in sensor networks, a hot topic that has been intensively researched in recent years. Due to some unique characteristics of sensor networks such as energy constraint and - hoc topology, the coverage

Read Book Barrier Coverage With Wireless

problems in sensor networks have many new scenarios and features that entitle them an important research issue in recent years. I have done my best to include in the book the most recent advances, techniques, protocols, results, and findings in this field.

Read Book Barrier Coverage With Wireless Sensors Iti Algorithmik Ii
